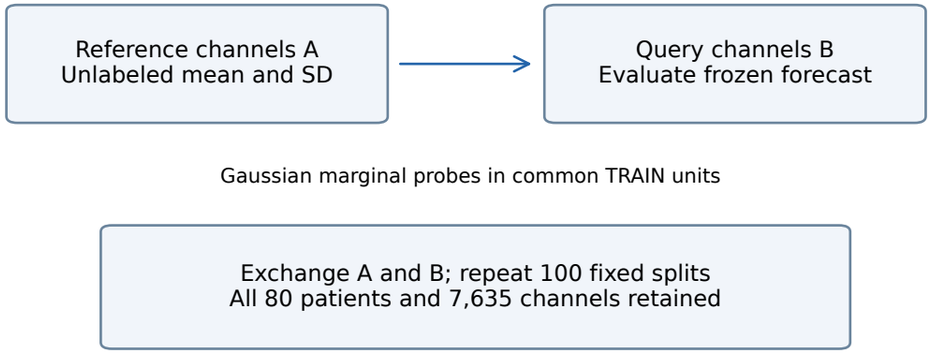
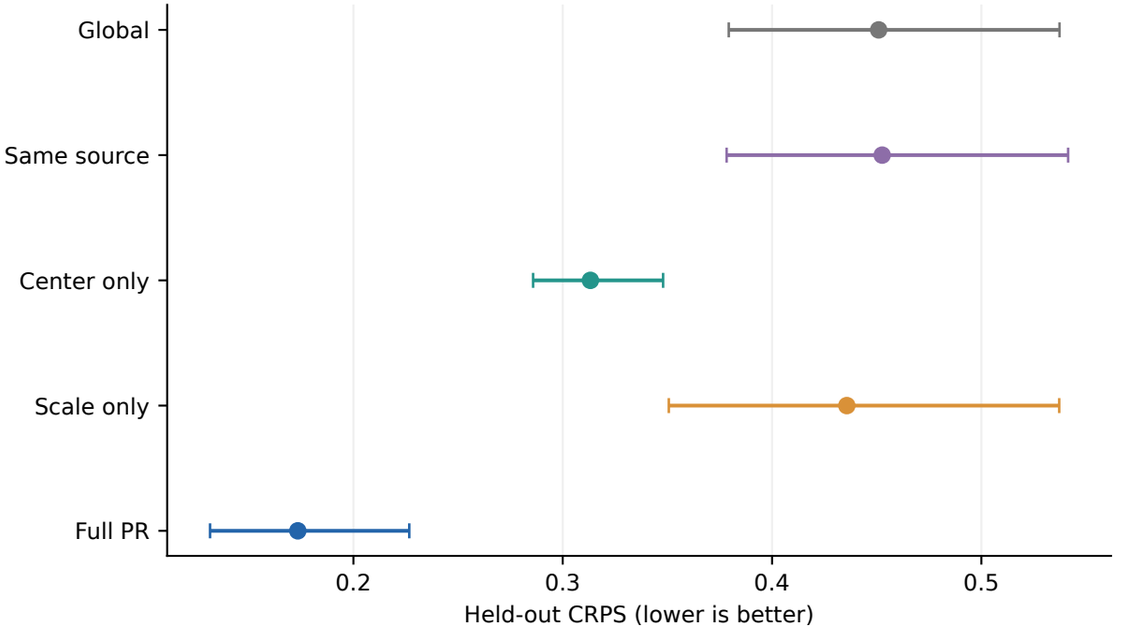
Patient-specific reference transfer before classification

A Disjoint-channel reference transfer



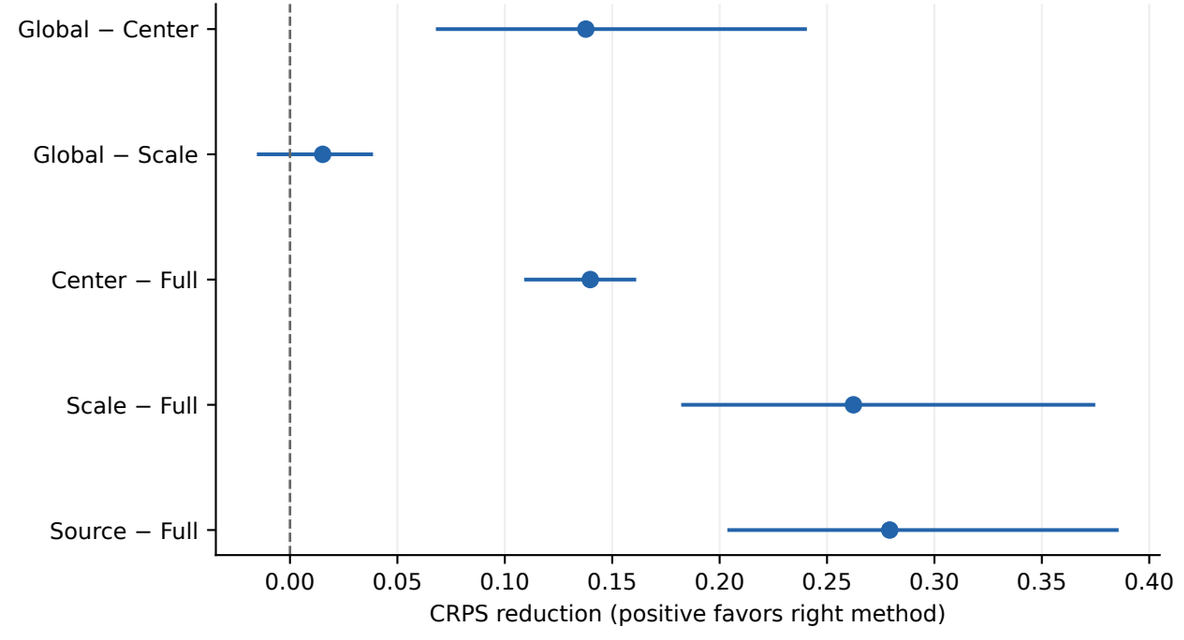
Design schematic; no simulated data shown.

B Background prediction



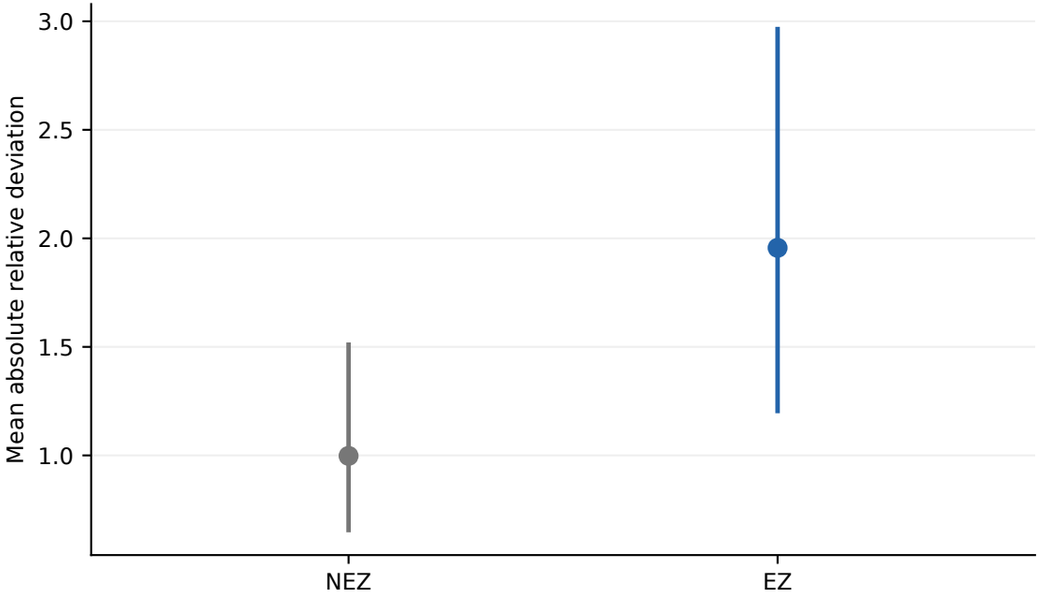
Equal-patient means; nominal 95% patient-bootstrap intervals.

C Contribution of location and scale



Six-family Bonferroni intervals; same paired patients.

D Residual EZ association



EZ − NEZ = 0.958464
Adjusted CI [-0.2508, 2.56101]
